```

Key Design Principles Applied:

1. Feature-Based Architecture

- Each feature (accounts, transactions, budgets) has its own folder with hooks, utils, and types
- Promotes modularity and easier maintenance

2. Component Hierarchy

- **ui/** - Basic reusable components (Button, Input, etc.)
- **forms/** - Specialized form components
- **charts/** - Data visualization components
- **lists/** - List item components
- **layout/** - Layout and container components

3. Screen Organization

- Each screen has its own folder with related components
- Screen-specific components are co-located for better organization

4. State Management Structure

- RTK Query for data fetching and caching
- Feature slices for local state
- Selectors for derived state
- Clear separation between API and UI state

5. Service Layer

- Clean separation of concerns
- Reusable services across features
- Platform-specific implementations

6. Utility Organization

- Constants for design system values
- Helpers for common operations
- Custom hooks for reusable logic

Memory-Friendly Development Strategy:

When the context gets full, you can ask for specific folders/files by referencing:

- **src/screens/[feature]/** - For specific screen implementations
- **src/components/[category]/** - For specific component types
- **src/features/[feature]/** - For feature-specific logic
- **src/services/[service]/** - For specific services

This structure ensures each part is self-contained and can be developed independently!
